Project history

- 1998, Rochester Conference, Vancouver
B.Maglich, API method
V.G.Kadyshevsky
- 1999, “Aspect” , R@D for Customs
- 2003, “ Aspect” , mobile prototype for Customs
- 2005, stationary detector

Basic Principles

Time distribution

Energy spectra in different time intervals

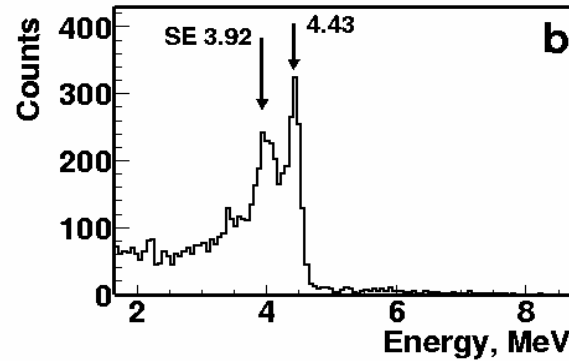

Counts $\times 10^{-2}$

Possibility of scanning in depth

Reliability of hidden substance detection

$$E_{\gamma}(^{12}\text{C}) = 4.43 \text{ MeV}, \quad E_{\gamma}(^{14}\text{N}) = 5.1 \text{ MeV}, \quad E_{\gamma}(^{16}\text{O}) = 6.13 \text{ MeV}$$

← ^{12}C

← melamine ($\text{C}_3\text{H}_6\text{N}_6$)

Signal/background ratio is better than 200

Идентификация вещества – по спектрам γ -квантов

Тротил
(C₇N₃O₆)
и
гексоген
(C₃N₆O₆)

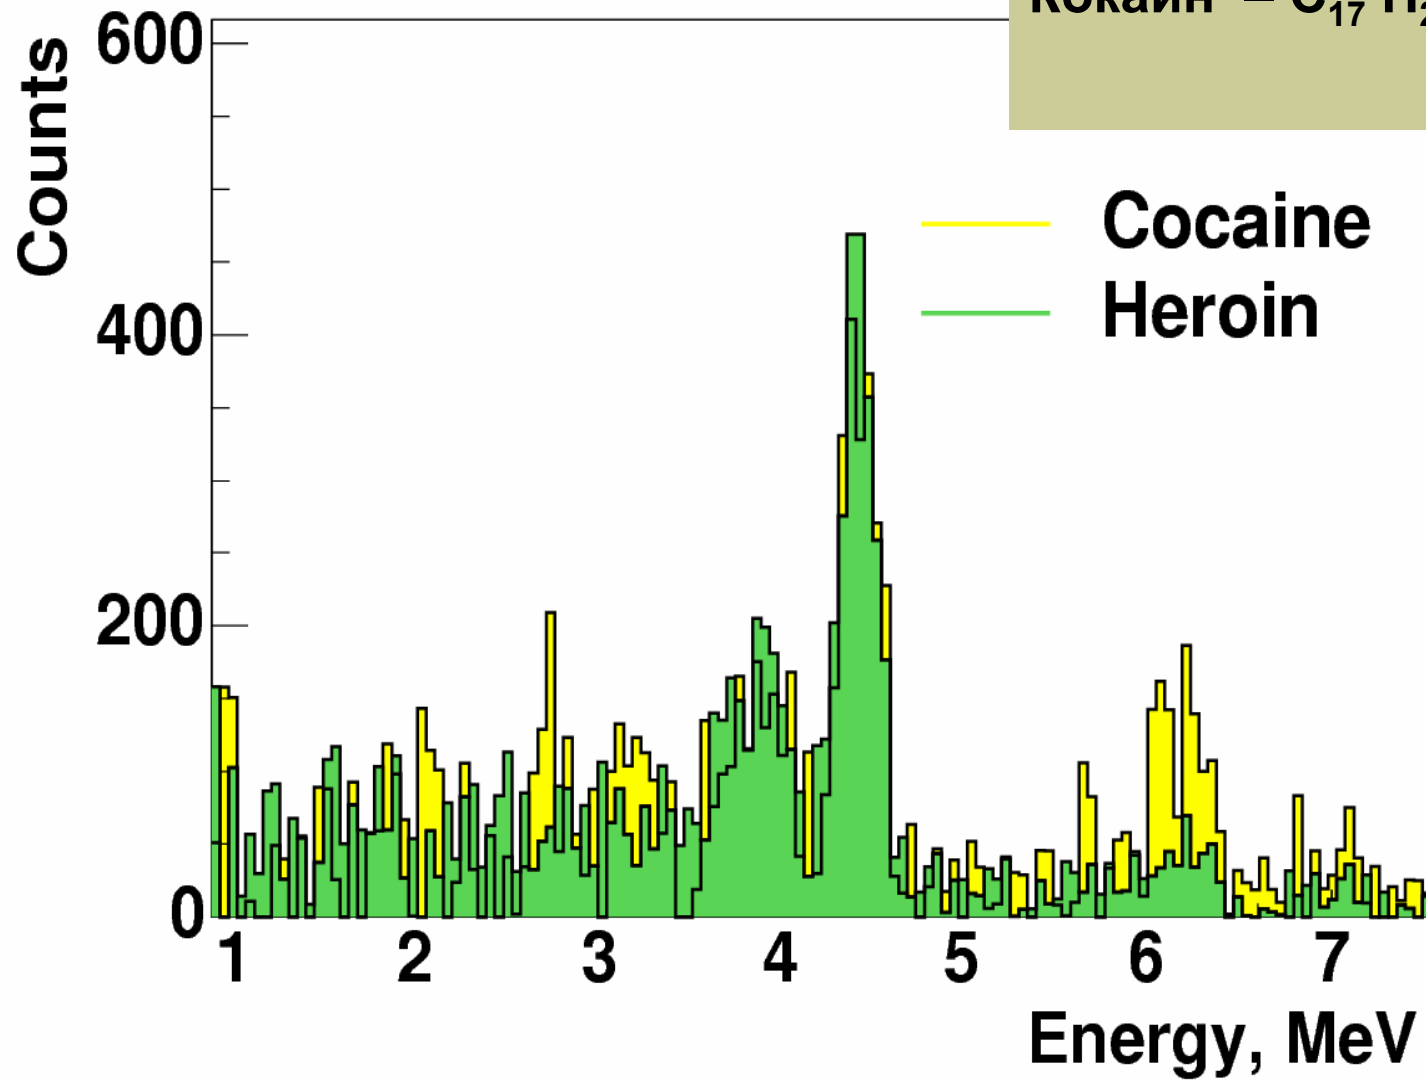

Спектры γ -квантов

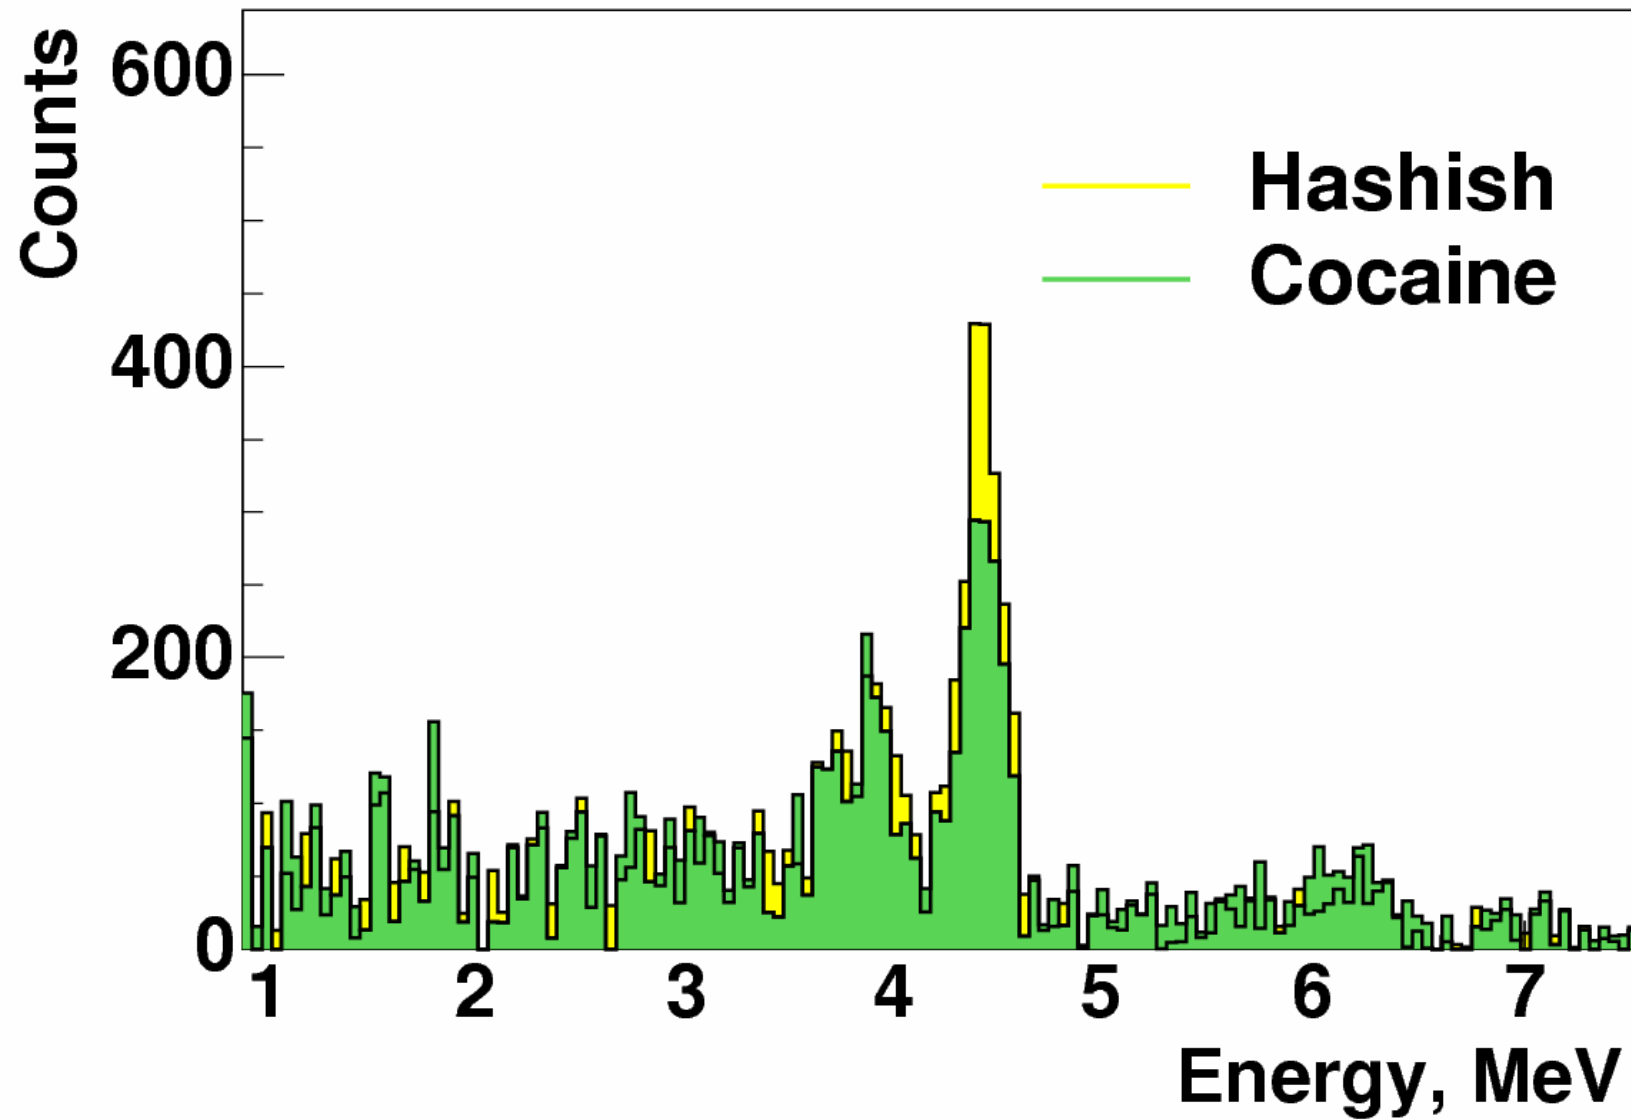

Селитра
(N₂O₃)
и
тротил
(C₇N₃O₆)

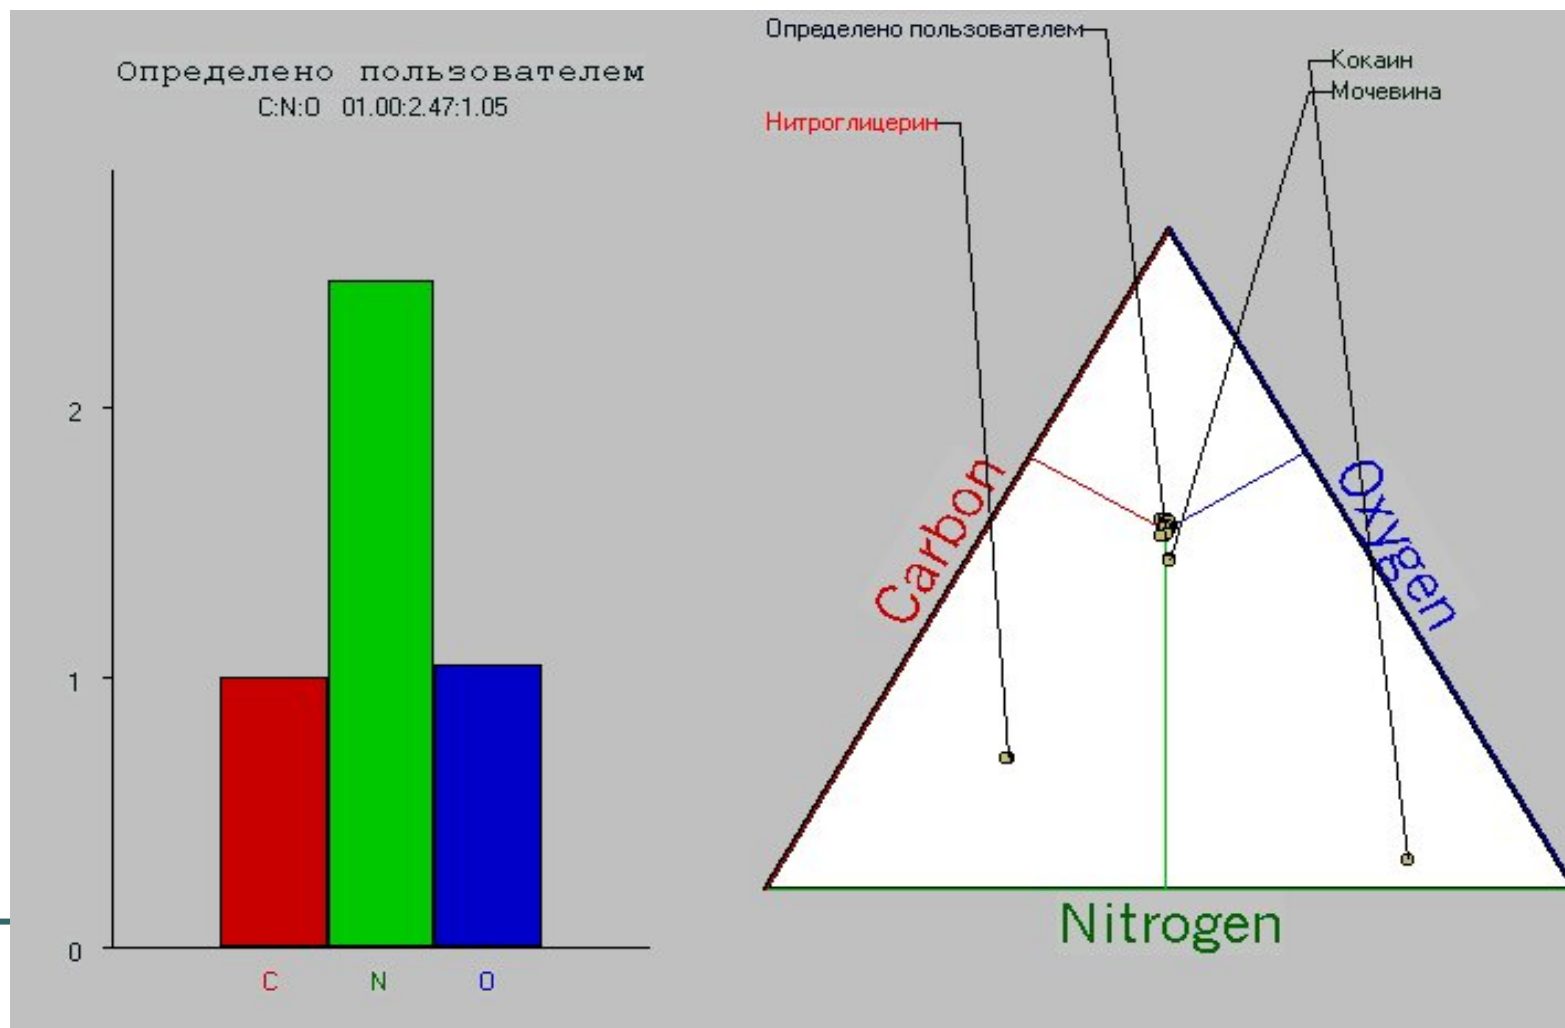

Героин – $C_{19}H_{17}O_5N$

Кокаин – $C_{17}H_{21}O_4N$

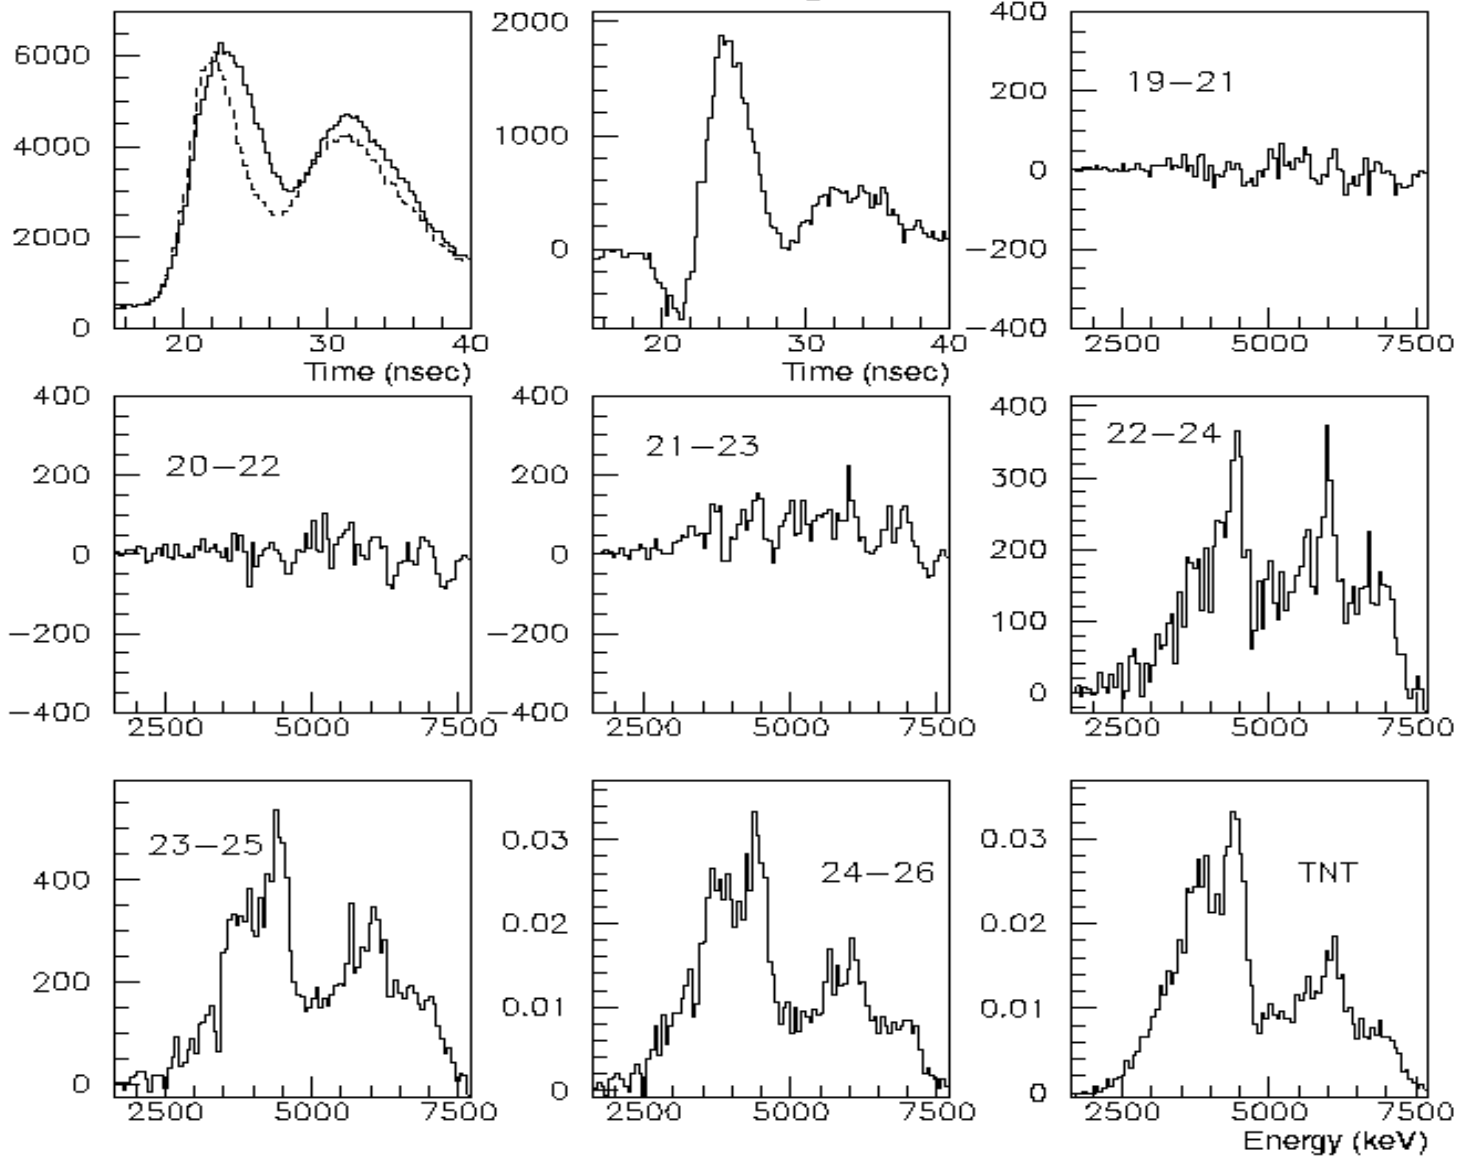

Urea: CN_2O

TNT in soil

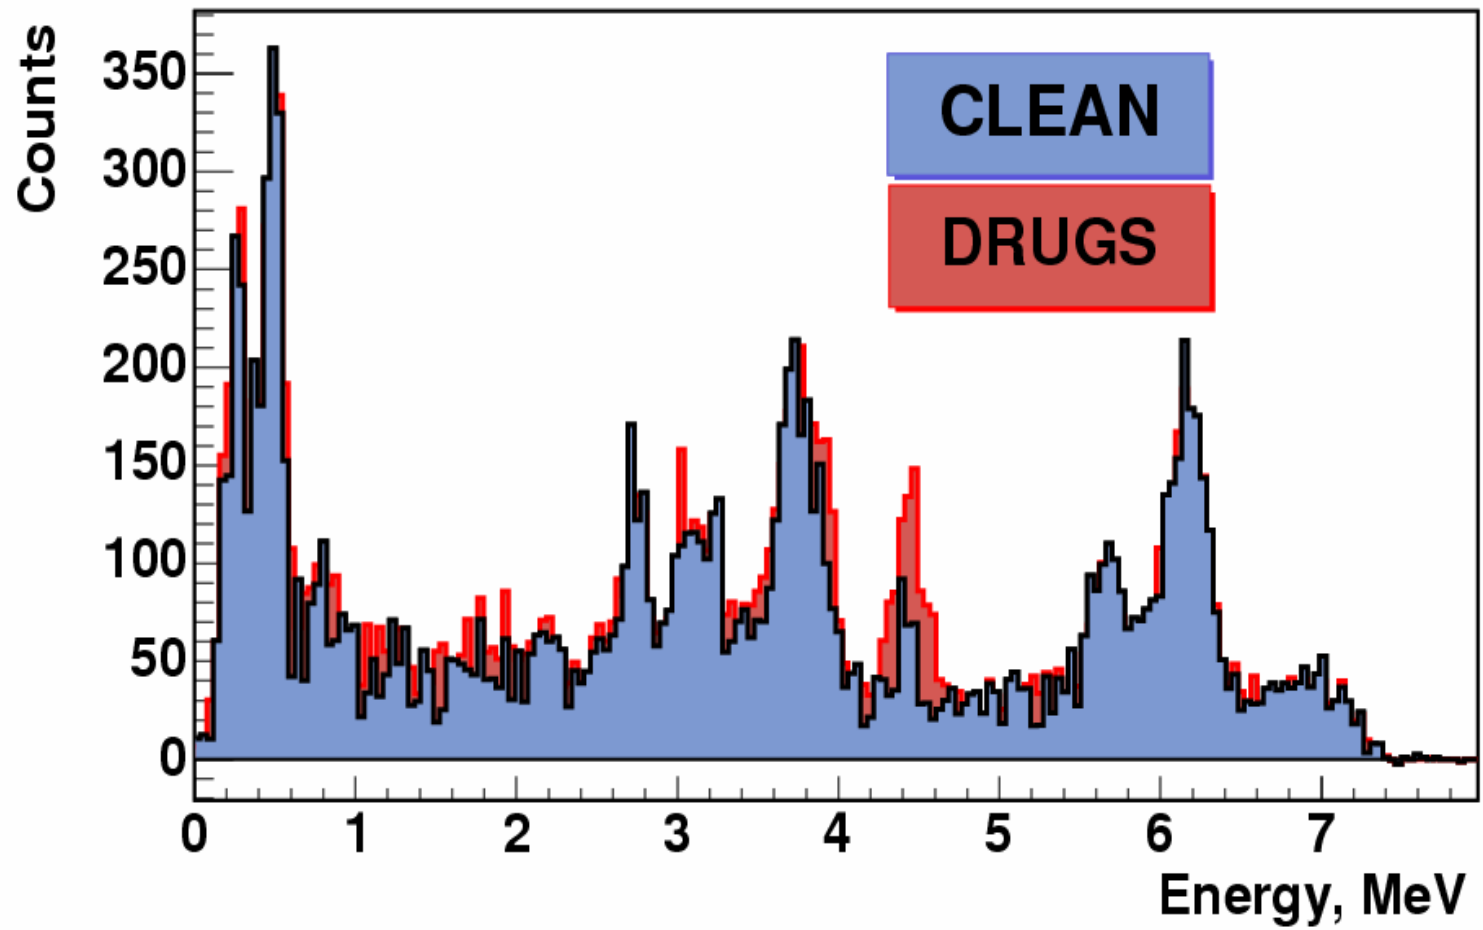

TNT underground.

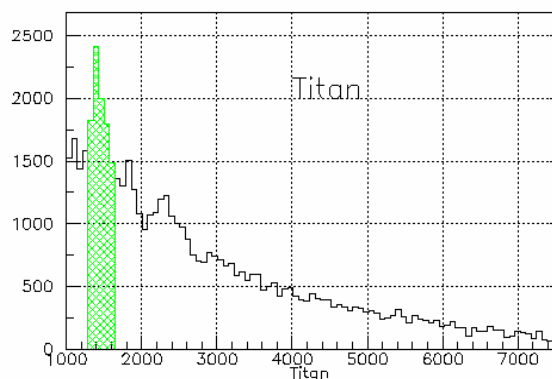

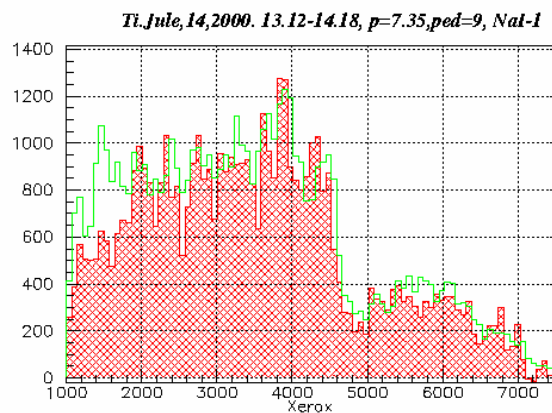

Melon in benzene

Идентификация долларов

Элемент	Доллар	Бумага
С	41%	47%
Н	6%	6%
О	46%	46%
S	-	0.11%
Пепел	7%	0.65%

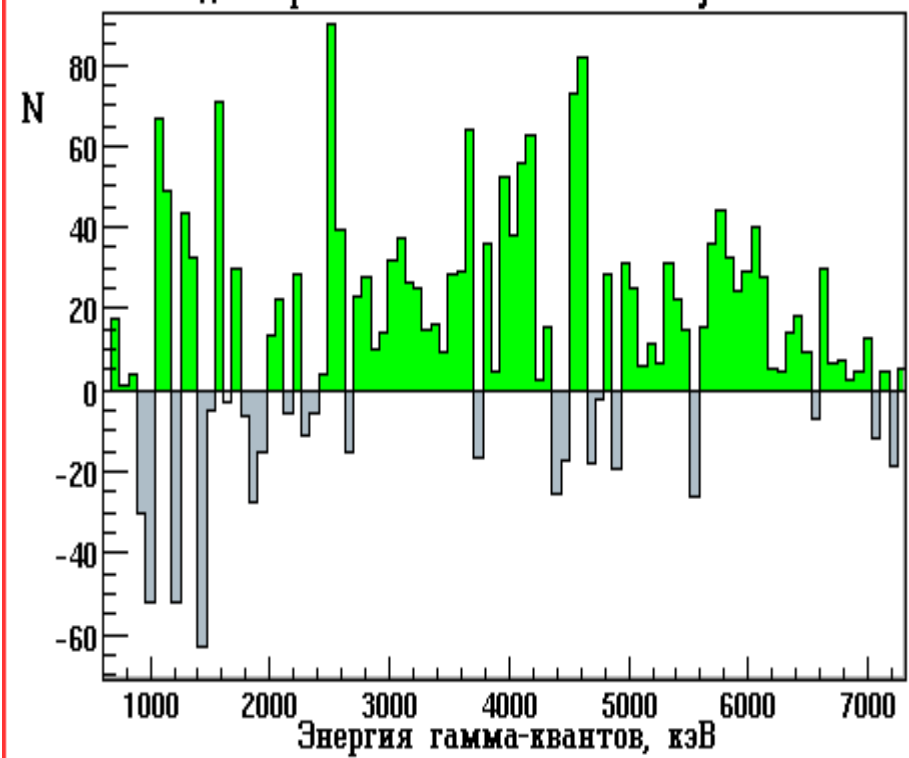

Основной элемент пепла :

- Титан: 63%

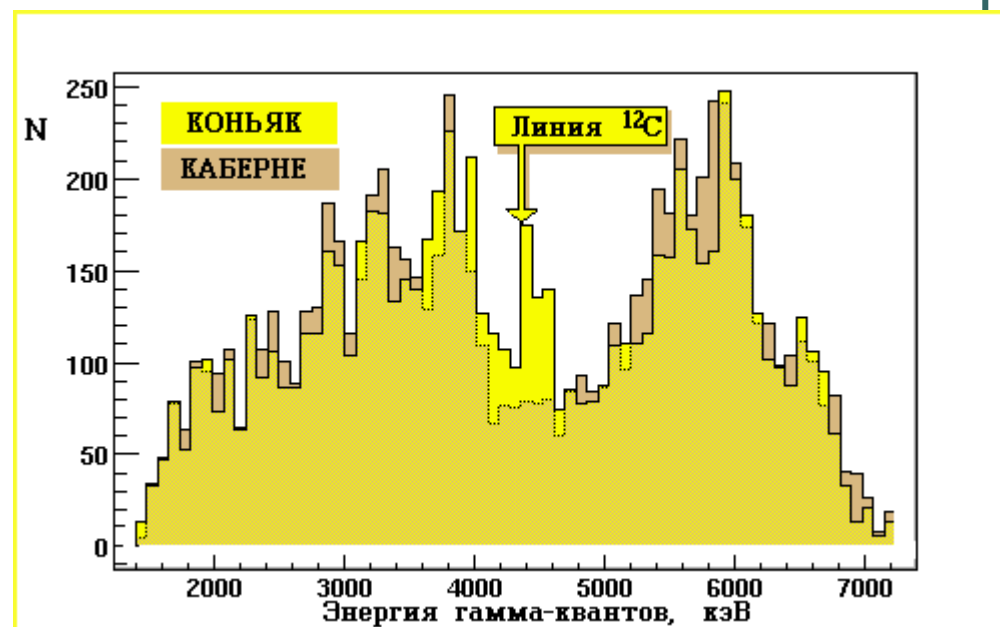

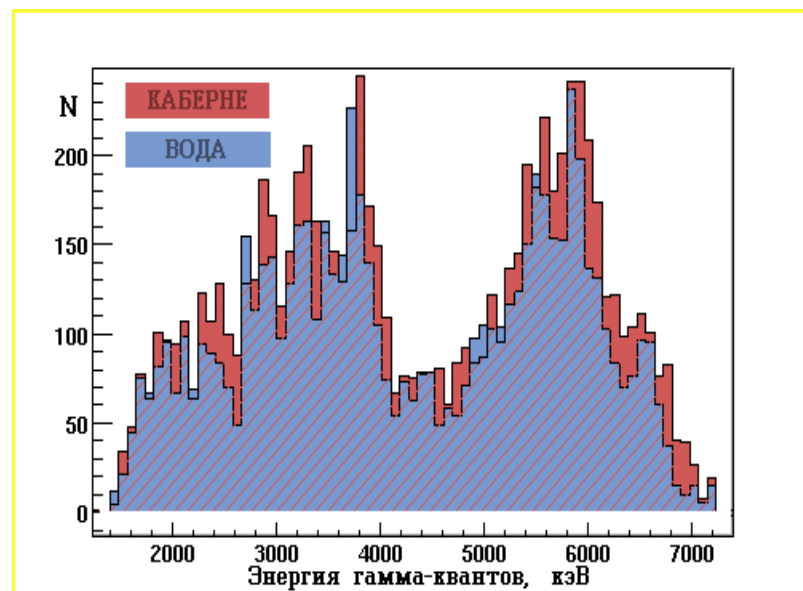

Результат опытов: доллары

Разница энергетических спектров
долларовых банкнот и обычной бумаги

Каберне/коньяк

Portable neutron generator

Five different types of PHG made by VNIIA (Moscow) have been tested

Neutron intensity:

$$I = (1-10) \cdot 10^7 \text{ c}^{-1}$$

Operation time: up to 650 hours.

α -detector on 9 channels

- Different types of α -detectors have been constructed and tested
- 9 cells $10 \times 10 \text{ mm}^2$

Развитие технической базы-2

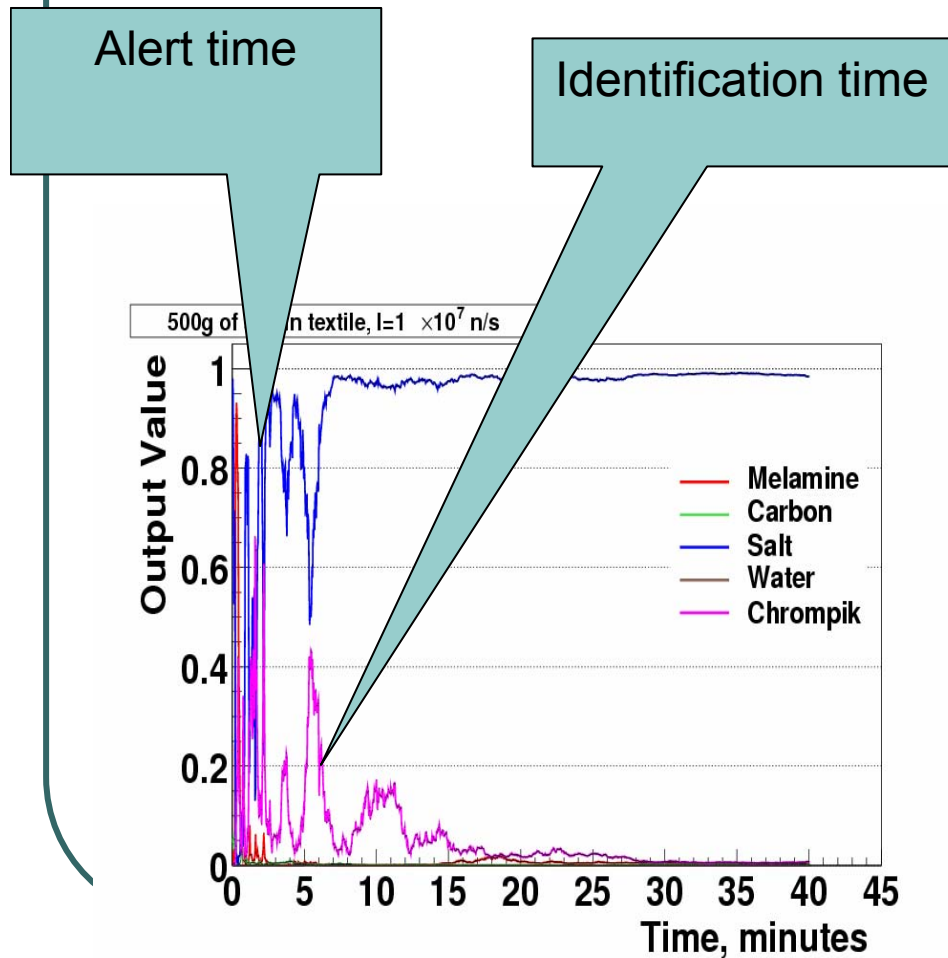

- α - детектор на 64-канала
- Размер пикселя – 4×4 мм²
- 4 кратное уменьшение минимальной массы

DAQ electronics

- PCI-card for 16 α - γ -channels has been developed

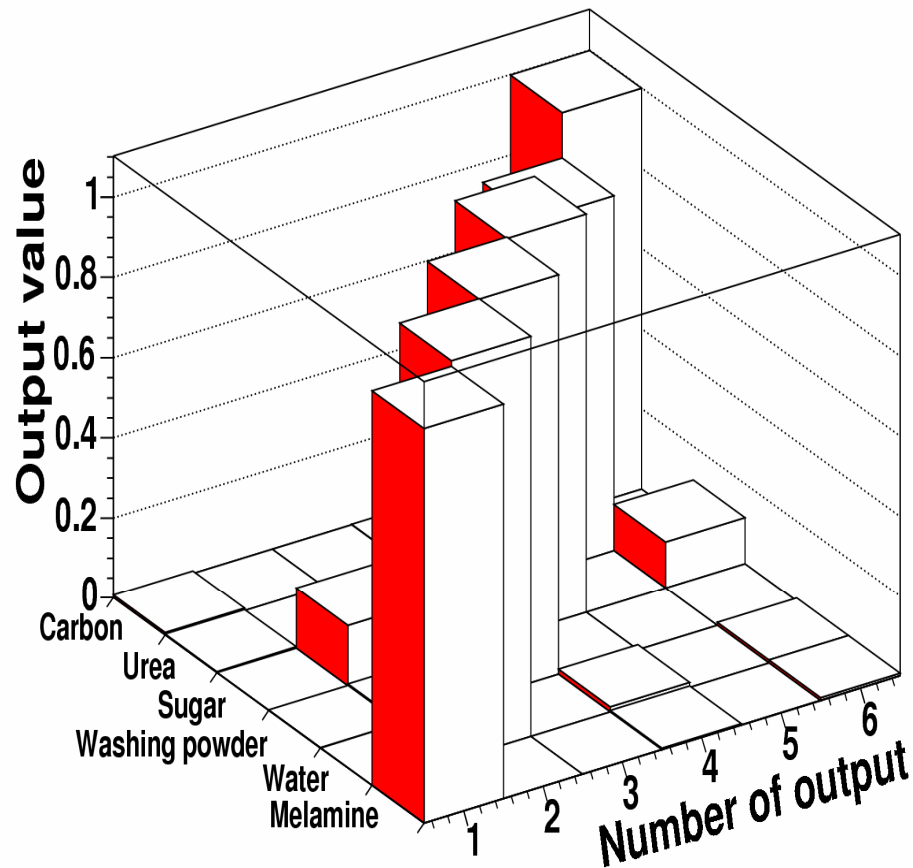

Identification of hidden substances by neural networks

- Neural net output $P > 0.8$ – alert time
- Identification time $P > 0.8$ for one substance
- $P < 0.2$ – for all other substances

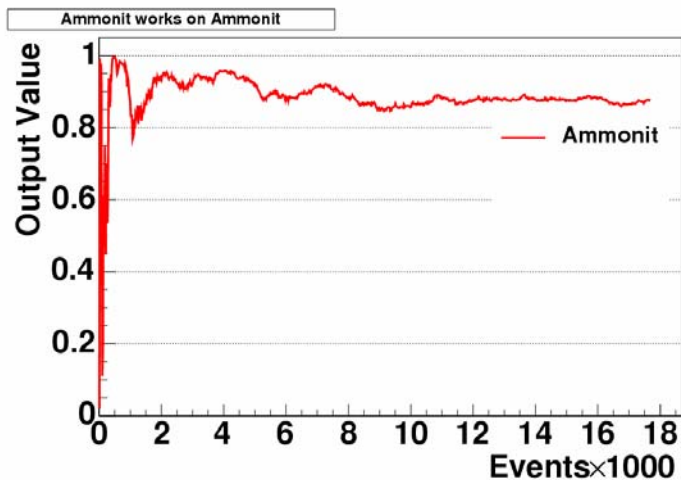

Identification of the hidden substance

Neural Network Test

The test of the neuron net performance. Along Y axis the number of interrogated substance is plotted. The results is the corresponding identification probability. It is plotted on Z axis.

Распознавание ВВ

- Изучена идентификация различных ВВ:
ТНТ, ТЭН, тетрил, гексоген, гранулит, аммонит, А-IX-1, А-IX-2, ПВВ-12А
- А-IX-1 – гексоген + 5% связующего вещества
А-IX-2 – гексоген + 20% алюминиевой пудры
- Сеть отличает А-IX-2 от А-IX-1 или от гексогена

Users interface

Режим

Дополнительная информация.

Время измерения: 10 мин
Размер объекта: большой
Расстояние до объекта: 60 см
Требуемое время: +10 минут

Информация о вокселе.

Опасное вещество: гексоген.
Достоверность: 75%
Координаты: 10×10×8 см

СТОП

Identification procedure is without operator

Collaboration with SPC “Aspect”

- Mobile prototype for Customs was constructed
- Work on prototype for large containers inspection is under way

Стационарная установка

- Работа по целеуказанию
- Целеуказание рентгеновский интроскоп

Stationary detector

Main advantages of the Associated Particle Imaging method

- Sensitivity to the C:N:O:Cl:Fe:Al.... composition of the substance
- Determination of the 3-D coordinates of hidden object
- Large penetration capability – up to 1-1.5 m
- Good conditions for the hidden substance identification. S/B=200 times higher than in traditional neutron activation analysis.
- Identification procedure is without an operator

Summary:

- The application of the Tagged Neutrons Method was tested successfully.
- Main components of the detector have been created.
- First prototypes have been constructed and tested in lab conditions.
- Useful tool, complimentary to the existing arsenal of devices.
